ACADEMIC EVENT HUB

Academic event management and analytics platform

MERN STACK

Project Overview

What Academic Event Hub is designed to solve

Centralized event hub

A single platform for creating, discovering, managing and tracking academic events.

Organized information

Events can be viewed through dashboards, lists, calendars and detailed event pages.

Analytics & reports

The planned system includes attendance, feedback, event analytics and report-generation views.

- Designed for academic departments and event coordinators
- Supports department-wise and joint-event views
- Includes a student-facing assigned-events area

Problem Statement

Why a dedicated academic event platform is useful

- Academic events can be difficult to organize when information is spread across multiple channels.
- Coordinators need a clear way to manage event details, participants and departmental activities.
- Students need an easier way to view assigned events and schedules.
- Institutions benefit from consolidated attendance, feedback and reporting.

Challenge

Scattered event information

Need

Centralized management

Goal

Better visibility & reporting

Objectives

Core goals of the project

Manage events

Create and organize academic events in one place.

Improve discovery

Provide list, filter and calendar-style views.

Track participation

Support attendance and assigned-event tracking.

Collect feedback

Provide a structured feedback and evaluation area.

Generate reports

Prepare event, department and summary reports.

Analyze activity

Visualize event and participation information.

Proposed System

High-level workflow

1

Login

User enters the academic event hub.

2

Dashboard

See events, counts and summaries.

3

Event Management

Create, view and manage events.

4

Participation

Assigned events and attendance.

5

Feedback

Capture post-event feedback.

6

Reports

Generate summaries and reports.

Planned end-to-end flow

Technology Stack — MERN

Selected technology for the project

MongoDB

Stores users, events, participation and related records.

Database

Express.js

Planned server-side API layer for application requests.

Backend API

React

Interactive dashboard and user-facing interface.

Frontend

Node.js

Runs the backend application and services.

Runtime

- MERN provides a JavaScript-based full-stack architecture.
- The technology stack is the selected implementation direction; the current project is still unfinished.

Key Modules & Features

Features visible in the current project design

Authentication

Welcome-back / sign-in screen

Dashboard

Event counts and summary cards

Department Views

Department-specific event analytics

Events

All Events and Joint Events lists

Calendar

Academic Event Calendar

Assigned Events

Student assigned-event tracking

Documentation

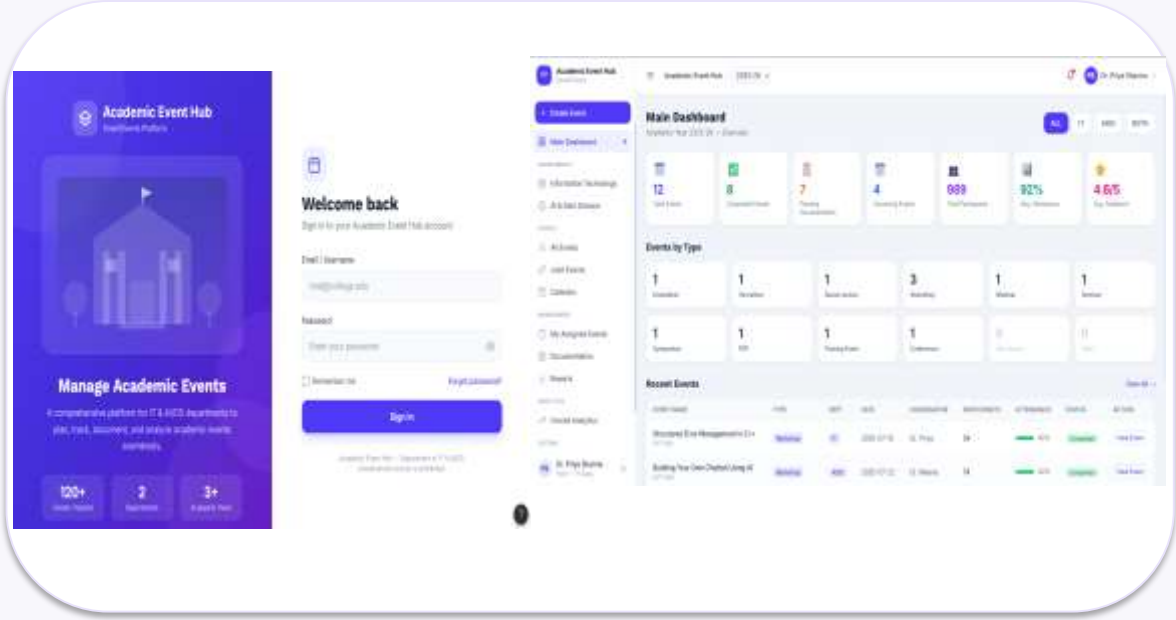

Event documentation area

Reports

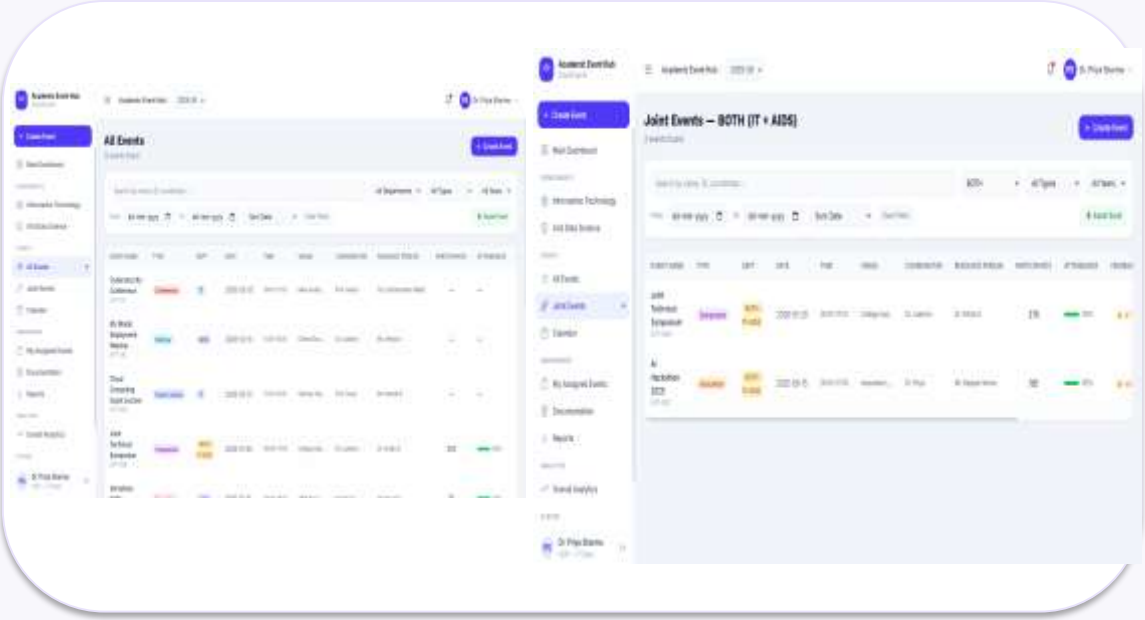

Individual, department and semester reports

Current UI — Dashboard & Event Management

Screenshots from the supplied project document

Login + Main Dashboard

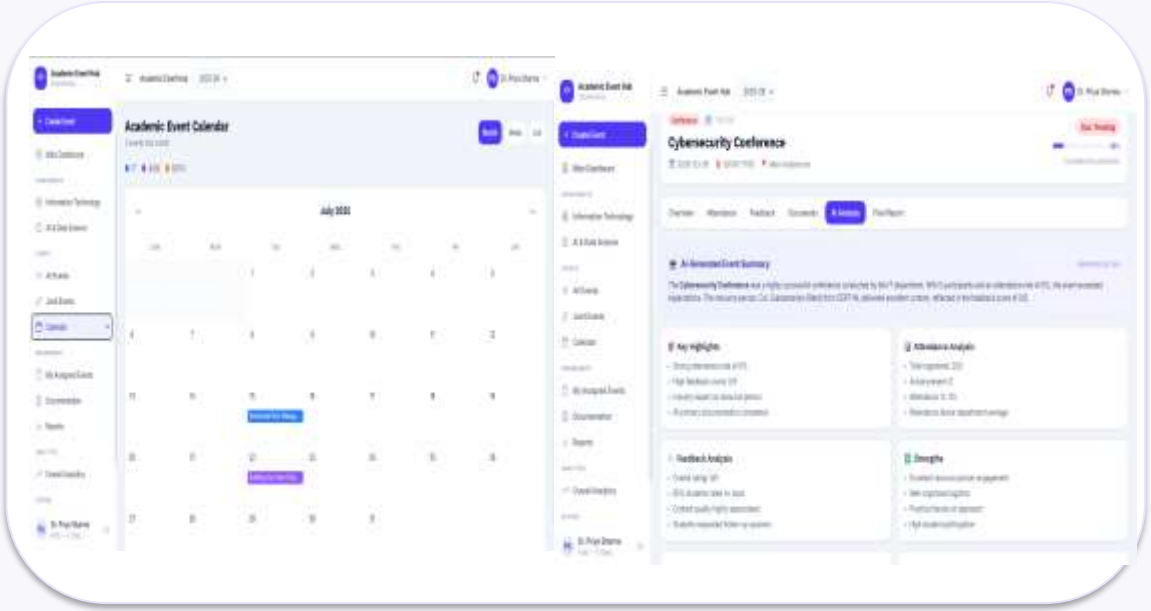

All Events + Joint Events

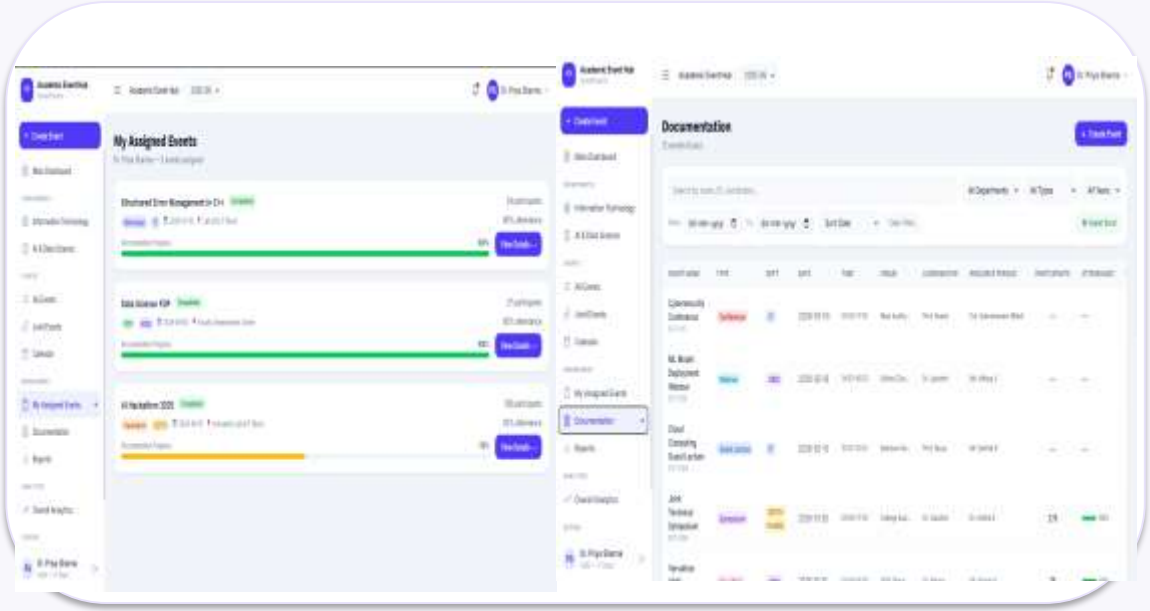

- The supplied document shows a dashboard with summary cards and event categories.
- Event-management screens include search/filter controls and structured event tables.

Current UI — Calendar, Assigned Events & Documentation

More screens shown in the supplied project document

Academic Event Calendar + Ai analysis

My Assigned Events + Documentation

- Calendar view is designed to provide a date-based overview of academic events.
- Assigned-events and documentation screens are included in the current interface design.

Current Development Status

Be transparent about the present state of the project

STATUS: PROJECT NOT YET FINISHED • TESTING NOT YET COMPLETED

What we have

A defined concept, MERN technology direction, and a substantial UI/design prototype covering dashboards, events, calendar, assigned events, feedback, analytics and reports.

What remains

Complete remaining implementation, connect and verify backend functionality, integrate database operations, and finish end-to-end workflows.

Testing status

The project has not been fully tested yet. Functional, integration, usability and performance testing are still pending.

Future Work & Testing Plan

Steps required before considering the project complete

- Finish the remaining frontend and backend implementation.
- Connect and verify MongoDB data operations.
- Implement and verify authentication and authorization flows.
- Test event creation, editing, filtering, calendar and assigned-event workflows.
- Validate attendance and feedback functionality.
- Test report generation and analytics outputs.
- Perform usability, integration and end-to-end testing.
- Fix defects and prepare a final deployable version.

Functional testing

Check each feature works as intended.

Integration testing

Verify frontend, API and database interaction.

User testing

Confirm the workflow is clear and usable.

Conclusion

Academic Event Hub aims to provide a centralized platform for academic event management, participation, feedback, analytics and reporting.

The current work establishes the project concept and interface direction. The implementation is still in progress and has not yet been fully tested.
